1. Introduction

The Great Britain Day Visits Survey (GBDVS) was launched in 2011. The GBDVS is designed to measure the volume and value of domestic tourism day visits (covering both leisure and business day visits) taken by British residents, as well as collecting information about visit characteristics and visit takers. Domestic tourism day visits are those taken by British residents within England, Scotland and Wales. A key purpose of the GBDVS is to uncover insights into market trends over time.

Due to the COVID-19 pandemic, it was not possible to collect data for the first 3 months of 2021. This is because all of Great Britain was under some form of 'lockdown' where leisure day visits were not permitted. Fieldwork re-started in England and Wales on 5th April 2021. It re-started in Scotland on 12th April 2021 due to restrictions being lifted a little later in Scotland. As respondents are asked about their day visit behaviour in the full week prior to interview, this means that data was collected about all of April 2021 for England and Wales, but only partial data is available for Scotland for April 2021, as visits were not permitted for all of April. Data was collected as normal for the rest of 2021, meaning that the full 2021 dataset runs from April to December. 2022 was collected for the full year, but comparisons cannot be made to January to March 2021.

The background quality report focusses on the current iteration of the Great British Day Visits Survey, although some references are made to the previous iterations where pertinent. This document will be updated on an annual basis, alongside the publication of the annual results. A separate background quality report is produced for the Great Britain Tourism Survey (GBTS).

3. Statistical presentation

3.1. Data description

The Great Britain Day Visits Survey provides monthly estimates of the volume and monetary value of domestic day tourism visits in Great Britain. The survey measures both business and leisure day visits, and collects information on visit characteristics, such as the duration, mode of transport, the activities undertaken on the visit, as well as information on the party composition. The results are produced monthly and are also aggregated to give quarterly, annual and three-yearly estimates. Results are split by geography, reason for visit, and activity undertaken on the visit.

In 2019 and earlier years the survey results were designated as official statistics. Due to the changes in methodology and the impact of the COVID-19 pandemic on tourism behaviour and the collection of data regarding tourism behaviour, 2020 was used as a pilot year, allowing for the new methodology to be tested and for additional analysis to be undertaken. For 2021 and 2022 the survey results have been badged as experimental statistics. The intention is to return to official statistics status in the future. Due to methodological and definition changes, 2021 data and beyond is not comparable to 2019.

3.2. Classification system

There are 4 definitions of qualifying day visits:

1. GB 3 hr+ Leisure Day Visits
2. GB Tourism Day Visits
3. GB Tourism Day Visits – Activities Core to Tourism
4. GB Business Day Visits

3.2.1. GB 3hr+ Leisure Day Visits

To be classified as a GB 3hr+ Leisure Day Visit, the visit must meet the following criteria:

- Last 3 hours or longer, including travel time
- Not be part of an overnight trip
- The main purpose of the visit is for leisure purposes
- Not started from holiday accommodation

3.2.2. GB Tourism Day Visits

GB Tourism Day Visits are a sub-set of GB 3hr+ Leisure Day Visits. To be classified as a GB Tourism Day Visit, the visit must meet the following criteria:

- Last 3 hours or longer, including travel time
- Not be part of an overnight trip
- The main purpose of the visit is for leisure purposes
- Be made less frequently than once a week
- Took place outside of the respondent's usual environment (in a different local authority to where the visit started from)

Or

- The main activity of the visit was watching live sports events, going to visitor attractions or going to special public events (does not need to be in a different local authority)

3.2.3. GB Tourism Day Visits – Activities Core to Tourism

GB Tourism Day Visits – Activities Core to Tourism are a sub-set of GB Tourism Day Visits. To be classified as GB Tourism Day Visits – Activities Core to Tourism, the visit must meet all of the criteria of GB Tourism Day Visits. In addition, a visit must have included one of the following as the main activity undertaken during the visit:

- Went to a visitor attraction e.g., a historic house, theme park, museum, etc.
- Went sightseeing and exploring areas
- Spa/beauty/health treatments
- Retreat or meditation
- Attended an organised public event (e.g., exhibition, concert, fair, live sport etc.)
- Visited an art gallery
- Visited a museum
- Went to a local cultural centre
- Watched live sport (not on TV)

3.2.4. GB Business Day Visits

To be classified as a GB Business Day Visit, the visit must meet the following criteria:

- Last 3 hours or longer, including travel time
- Not be part of an overnight trip
- The main purpose of the visit is for business purposes
- Be made less frequently than once a week
- Took place outside the respondent's usual environment (in a different local authority to their start location)

3.2.5. Geographical classifications

For geographical classification standard GB regions are used, as defined by the Office for National Statistics. The nations of Scotland and Wales are further broken down into sub-regions:

Scotland:

- Scotland North – consisting of the local authorities of:
 - Aberdeen City
 - Aberdeenshire
 - Highland
 - Moray
 - Orkney Islands
 - Shetland Islands
 - Western Isles (Na h-Eileanan Siar)
- Scotland South – consisting of the local authorities of:
 - Dumfries and Galloway
 - Scottish Borders
- Scotland East – consisting of the local authorities of:

GBDVS Background and Quality Report

- Angus
- City of Edinburgh
- Dundee City
- East Lothian
- Fife
- Midlothian
- Perth & Kinross
- West Lothian
- Scotland West – consisting of the local authorities of:
 - Argyll & Bute
 - Clackmannanshire
 - East Ayrshire
 - East Dunbartonshire
 - East Renfrewshire
 - Falkirk
 - Glasgow City
 - Inverclyde
 - North Ayrshire
 - North Lanarkshire
 - Renfrewshire
 - South Lanarkshire
 - South Ayrshire
 - Stirling
 - West Dunbartonshire

Wales:

- Mid Wales – consisting of the local authorities of:
 - Ceredigion
 - Powys
- North Wales – consisting of the local authorities of:
 - Anglesey
 - Conwy
 - Denbighshire
 - Flintshire
 - Gwynedd
 - Wrexham
- South East Wales – consisting of the local authorities of:
 - Blaenau Gwent
 - Bridgend
 - Cardiff
 - Caerphilly
 - Merthyr Tydfil
 - Monmouthshire
 - Newport
 - Rhondda Cynon Taff
 - Torfaen
 - Vale of Glamorgan
- South West Wales – consisting of the local authorities of:

- Carmarthenshire
- Pembrokeshire
- Neath Port Talbot
- Swansea

3.3. Sector coverage

The survey is amongst members of the public and so sector coverage is not applicable in this case. However, it is worth noting that the statistics from the survey are used by businesses in the tourism sector, and those that are dependent on tourism.

3.4. Statistical concepts and definitions

Volume: An estimate of what the grossed-up number of day visits undertaken by the population, within the time period and other parameters specified, would be if the quota sample is representative of the whole GB population.

Value: An estimate of what the total expenditure relating to the volume of day visits undertaken by the GB population, within the time frame and other parameters specified, would be if the quota sample is representative of the whole GB population. Expenditure includes the cost of bookings paid in advance, other items bought for the purpose of the visit and payments for bills related to the visit received after the visit. Expenditure also includes any bills paid on the respondent's behalf, such as anything paid for by an employer for a business trip. Only fuel purchased during the visit is included. Only food consumed during the visit is included.

Party composition: The number of adults and children in the immediate party that undertook each day visit.

Place visited: The name of the village, town or city visited, or the nearest village, town or city. National Parks are treated as a place and can be selected from the list of places (gazetteer). Respondents are asked to select the 'main place' they visited and then any other places they visited. They are instructed to exclude any short stops for purposes such as buying fuel, using a toilet, using a cash machine or picking someone up.

Type of place visited: Respondent classification of the type of place visited into one of the following categories:

- City/large town
- Small town
- Village
- Rural countryside
- Seaside resort or town
- Seaside coastline – a beach
- Other coast
- Other

Time spent travelling during visit: This includes travelling to and from all of the places visited, but does not include any short walks (less than 10 minutes) taken to get between locations and places visited.

3.5. Statistical unit

Data is collected about the number of day visits taken by individual adults (aged 16+). A specific adult can have taken more than one day visit in the time period specified. Information is also collected about the presence of any children on these day visits, allowing estimations to be produced about adult and child visits, although children are not sampled.

The estimates of volume and value of visits presented are grossed-up to the total population of the geography in question (i.e., GB, England, Wales or Scotland). This shows what the values and volumes would be for the total population if the quota sample is representative of the whole GB population.

3.6. Statistical population

Adults aged 16+ in England, Scotland and Wales. The survey also collects details of any children involved with day visits and these are included in the estimated grossed-up figures for volume and value.

3.7. Reference area

All respondents reside in Great Britain (England, Scotland or Wales). Data is collected about day visits taken to places within Great Britain and Northern Ireland.

Great Britain does not include the crown dependencies of the Isle of Man or the Channel Isles and no data is collected about visits to these areas.

Data collected about visits purely to Northern Ireland is not included in any of the reporting for GBDVS, but it is shared with the Office for National Statistics so that it can be combined with data from an equivalent survey conducted by the Northern Ireland Statistics and Research Agency. If a visit involves time spent in Northern Ireland and one or more locations within Great Britain the information related to the places visited within Great Britain are included in GBDVS reporting. As one of the ways to report GBDVS data is split by characteristics related to the main place visited, it is possible that a small number of visits may contribute to GB visit and spend estimates without having a 'main place' within GB.

3.8. Time coverage

The statistics cover the time period from January 2022 to the end of December 2022. Older time series are described in section 9.2 'Comparability over Time'.

3.9. Base period

This is not applicable.

4. Statistical processing

4.1. Source data

Data are based on a survey.

The survey population is adults aged 16+ and residing in England, Scotland and Wales. However, information is collected about any children present and so resulting estimations include adults and children.

4.1.1. Sample design

A non-probability method is used, with stratification by country (England, Scotland and Wales) and quotas set within each country. A non-probability approach was used for two main reasons; efficiency of data collection within the online methodology, and comparability with time-series data.

In general, probability survey methods are costlier and take more time to administer than non-probability methods. The cost of probability methods has also been increasing over recent years due to higher levels of non-response. If response rates are low, the potential for bias in the probability sample is higher. This is particularly the case if the profile of non-responders is systematically different to respondents.

While probability sampling allows for statistical techniques such as confidence intervals and margins of error to validate the results, this is not possible with a non-probability sample. As such, robust estimations of the behaviour of the entire population cannot be made with a non-probability sample. Quotas and weighting have been used to make the sample as representative of the GB adult population as possible within the confines of a non-probability sample.

GBDVS has used an online panel non-probability sample since its inception in 2011 when the English Tourism Intelligence Partnership (ETIP) pilot determined an online methodology approach. The key objective of GBDVS is to provide data comparability over time, and to ensure that data collected from 2021 onwards is comparable with historic data. Changing to a probability methodology at this stage would have consequences for comparability to previous years.

The survey sponsors weighed up the advantages of a probability sample against the disadvantages and made the decision that a non-probability sampling methodology better suited their needs and the available resources.

Government Social Research (GSR) guidelines on the reporting of results when quota sampling is used have been followed as much as possible, namely:

- The characteristics used to set quotas have been carefully considered. Additional work was undertaken in 2021 to investigate whether there is any potential bias in the sample collected, and if so, the magnitude of this bias. A key part of this analysis was to compare the collected sample to publicly available robust statistics to determine if any groups are under or over represented in the surveys. This analysis showed that the survey data is broadly comparable for presence of children in the

household, ethnicity, level of education, car ownership, sexual identity, age (up to 75) and employment status.

- Interlocking quotas have been used where feasible. Age and gender quotas are interlocked, which account for the majority of quota cells
- The weighting model is designed to adjust the results for non-response. As a result of the analysis described above around potential bias in the collected sample it was agreed that the weighting categories for age would be adjusted for 2021 onwards, so that the oldest age group (previously 65+) was split into 65-74 and 75+.
- The reporting, including this background quality report, sets out why quota sampling has been used
- The reporting, including this background quality report, sets out how the results should be interpreted

The GSR guidelines can be found here: [Quota-sampling-guidance-4.pdf \(civilservice.gov.uk\)](#)

4.1.2. Population

Information about the population comes from the latest available national statistics for each country. These are updated yearly. Population statistics come from 2 different sources:

- Statistics on the total population by devolved nation, and the split by region, gender and age were sourced from the mid-2018 population estimates produced by the ONS. These were the most recent available statistics at the time of finalising the sample specification. The statistics can be found here: <https://www.ons.gov.uk/peoplepopulationandcommunity/populationandmigration/populationestimates/bulletins/annualmidyearpopulationestimates/mid2018>
- Statistics on the approximated social grade were sourced from the annual population survey produced by the ONS. The time period used was July 2018 – July 2019. These were the most recent available statistics at the time of finalising the sample specification. The statistics can be found here: <https://www.nomisweb.co.uk/datasets/apsnew>.
 - As the National Statistics Socio-economic Classification (NS-SEC) is a harmonised standard in UK official statistics, for the purpose of quotas and weighting, the population statistics for NS-SEC from the Annual Populations Survey are mapped to the approximated social grade collected in the GBTS and GBDVS surveys. The ONS recommended considering whether the use of NS-SEC as a question set may be more appropriate. However, as NS-SEC requires at least 4 questions to be asked to be determined, it was agreed with the National Tourism Organisations that there is not sufficient space to ask NS-SEC in GBTS and GBDVS.

4.1.3. Sampling frame

- Data is collected through an online survey using a sample of individuals registered with online survey panels.
- Respondents are sourced via Qualtrics, an online platform that combines a number of ESOMAR accredited online panel providers. A blend of 4 panels is used to mitigate against the risk of panel specific biases.
- Each of the panel providers have small biases in their total panel population. However, the use of quotas mitigates against this bias.

- The blend of panels is consistent for each month of fieldwork to ensure that the sample is stable.
- A 3-month exclusion clause is used to ensure that no one individual respondent can complete the survey too frequently.
- Each panel has their own procedures, in line with ESOMAR guidelines¹ for ensuring the information they hold about each panellist is up to date and complete. Furthermore, all quota variables are collected within the survey to ensure that respondents are categorised appropriately.

4.1.4. Quotas

The annual sample size for a full year is 35,000 respondents. This includes all respondents, whether they have taken a qualifying day visit or not. This 35,000 is split disproportionately by country, to allow for larger base sizes for analysis for Scotland and Wales:

- England – 25,000
- Scotland – 5,000
- Wales – 5,000

Quota sampling controls the composition of the final achieved sample ‘by design’. In quota sampling targets are set for each quota category and once this target has been reached, no further interviews in that category are collected.

The quotas are set based on national statistics about the GB adult population, as described above (under ‘population’ in section 4.1.2). Respondents in Scotland and Wales are oversampled to ensure the resulting base sizes allow for robust analysis.

Within each country quotas are set on age x gender (interlocking), approximated social grade and English regions. Hard quotas are set for each 4 weeks of interviewing, as below:

REGION	%	GBDVS target	Age/Gender	%	GBDVS target
England	70%	1924	Male 16-24	7%	184
Scotland	15%	384	Male 25-34	8%	228
Wales	15%	384	Male 35-44	8%	208
Total	100%	2692	Male 45-54	8%	228
East Midlands	6%	168	Male 55-64	7%	196
East of England	8%	212	Male 65+	10%	280
London	11%	300	Female 16-24	6%	172
North East	3%	92	Female 25-34	8%	224
North West	9%	252	Female 35-44	8%	212
South East	11%	316	Female 45-54	9%	232
South West	7%	196	Female 55-64	8%	204
West Midlands	7%	200	Female 65+	12%	332
Yorkshire and the Humber	7%	188	Approximated social grade		
Total	70%	1924	AB	12%	316
			C1	30%	800

¹ <https://esomar.org/code-and-guidelines/icc-esomar-code>

C2	23%	608
DE	36%	972

Quotas are monitored on a weekly basis to ensure they are achieved as evenly as possible across each 4-week period.

4.2. Frequency of data collection

Data collection is carried out throughout all four or five weeks of a given month. Data is reported on a calendar month, quarterly and yearly basis. Some analysis also uses a rolling 12-month period, year-to-date and 3-year average classifications.

Each respondent is asked about any day visits that they may have taken in the full week prior to their date of interview e.g., if an interview is completed on Wednesday 6th July 2022, the respondent will answer about day visits taken between 27th June 2022 and 3rd July 2022. Data is reported in regards to this 'reference' period, rather than the date of interview.

Each full week within the year is allocated to a single reporting month. It is allocated to the reporting month that has the most days in it from that week. Therefore, some months are made up of 4 weeks, and some of 5 weeks. In the example described above the data will fall under the 'June 2022' reference period as the majority of week commencing 27th June 2022 falls into the month of June.

To aid usability of the results by users, a correction factor, called the Seasonal Smoothing Factor, is then applied to 'convert' the data for the 4- or 5-week reporting period into a 'calendar month' period. This correction factor takes into account the number of days in a 4- or 5-week reporting period and the number of days in the calendar month in question. This correction factor is applied equally to all visits taken within the period. It is applied to increase comparability of data across years, thus removing the element of whether a month is represented by a 4- or 5-week period. It is important to note that data for the reporting period is still taken over a 4- or 5-week period. More detail on the Seasonal Smoothing Factor can be found in 4.5.3.

4.3. Data collection

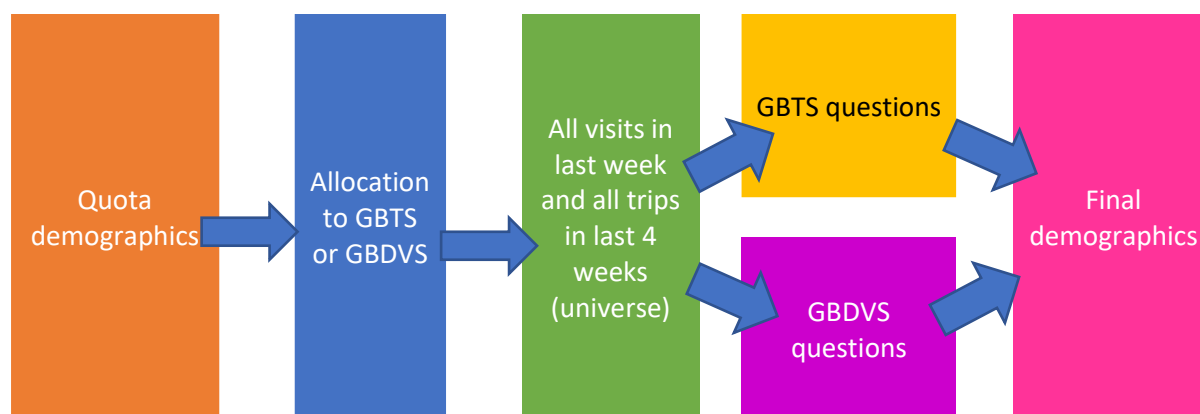

Data collection is online, via Qualtrics, an online platform that combines a number of ESOMAR accredited panel providers. The survey is device agnostic, meaning that respondents can complete on a desktop PC, laptop, tablet or mobile device.

Data collection for GBDVS is combined with collection for the Great Britain Tourism Survey (GBTS). While GBDVS measures day visits, GBTS measures overnight trips. In 2019 and earlier years, the two surveys were undertaken as separate standalone surveys using different survey methods. To allow greater control and to gather more relevant and comparable information the two surveys were combined. The two surveys have been combined into one script, with two possible routes.

The script has 5 sections (the full questionnaire can be found in the appendix of this document):

1. Quota demographics
2. Universe trips
3. GBTS
4. GBDVS
5. Final demographics

All respondents are asked sections 1,2 and 5. Allocation to sections 3 and 4 is determined by the script on a least full basis, after section 1 has been completed, but before any data is collected for section 2. This means that a respondent can be allocated to GBDVS, even if they have not taken any qualifying day visits in the reference period. In such a case the respondent would be asked sections 1 and 2, and then skip to section 5. This ensures that the sample is not biased by responses to the universe section.

4.3.1. Testing of data collection procedures and systems

As part of the set-up of the combined GBDVS and GBTS survey the script was thoroughly tested to ensure that all of the routing and data validation aspects were working as desired. A live pilot was also conducted to allow the scripts to be fully tested. The pilot took place between 23rd April and 20th May 2020. 1,830 pilot surveys were completed for GBDVS.

Fieldwork for the pilot took place during the initial COVID-19 lockdown in the UK. As the lockdown restricted movement and did not allow leisure visits to be undertaken, some changes were made to the pilot script to allow reliable and useful data to be collected:

- The introduction was amended to reflect the fact that respondents wouldn't have taken any day visits in the previous few weeks and reference to the COVID-19 lockdown was included
- The reference dates were amended so that every respondent was asked about visits in the same period – between 9th March and 22nd March 2020 – a period of 2 weeks to maximise the likely incidence of visits
- Minor changes were made to the question wording to reflect the fixed periods referred to in the survey

Pilot data was analysed to evaluate the design of the survey. The following elements were included in the analysis:

- Analysis of the sample achieved to ensure it was balanced
- The random allocation to either GBTS or GBDVS

- The routing in the survey script
- Survey length
- The dropout rates
- The incidence of qualifying visits, with comparisons made to the previous iterations of the survey
- The region of residence stated by respondents, compared to the specific place they selected as residing in
- Number of activities undertaken
- Visit spend – taking into account party size and the types of activities undertaken
- Party size
- Method of transport used
- Feasibility of places visited if more than one place selected

No changes were made to the survey script, data collection procedure or systems as a result of the pilot.

4.3.2. Checks applied at data entry stage

As the survey uses an online methodology all of the checks at data entry stage are built into the survey script. The following checks are in the questionnaire:

- Q003 – place of residence – respondents must select from a drop-down list containing 61,442 cities, towns and villages in the UK
- Q005 – respondent’s age – any respondents aged 15 or under are automatically screened out of the survey
- DV04 – main place visited – respondents must select from a drop-down list containing 61,442 cities, towns and villages in the UK
- DV07 – other places visited - respondents must select from a drop-down list containing 61,442 cities, towns and villages in the UK
- DV09 – place visit started from - respondents must select from a drop-down list containing 61,442 cities, towns and villages in the UK
- DV13 – time spent travelling during visit – respondents are able to enter a maximum of 36 hours and 59 minutes as anything longer than this would have required an overnight stay (even in transit) and so would not qualify as a day visit
- DV15 – party size – a maximum of 50 is allowed for each type of party member
- DV19b – party size that the respondent is giving spend information for – respondents are not able to enter a greater number of adults or children here than entered at DV15. If they do, an error message is displayed that asks them to check and edit the figures they have entered
- DV20 – spend on visit – if zero is entered for all spend categories an error message is shown: “You have said that you didn’t spend anything on your trip. Is this correct? If not, please change your answers”. The respondent is allowed to proceed with zero spend, as this is a possible scenario
- DV20 – spend on visit – if a value greater than £500 is entered for any of the individual spend categories a warning message is shown to the respondent: “You entered more than £500 for an item. Is this correct? If not please change your answers”. The respondent is allowed to proceed with spend greater than £500, as this is a possible scenario

- DV22 – spend per place if more than one place visited, excluding transport – the total at this question is not permitted to be greater than the total spend entered at DV20, excluding transport categories

As the survey is online the script is designed so that a respondent cannot continue to the next question unless a response is given. Most questions, however, have a ‘don’t know’ option to ensure that each respondent can answer truthfully. The procedure for ‘don’t know’ responses is detailed in 4.4.

4.4. Data validation

Data is downloaded from the Qualtrics survey platform on a monthly basis. Many checks on the data are performed via an automated rules-based system. However, in the first two waves of fieldwork all of these automated checks were manually double checked to ensure that they were working correctly.

The process for data validation follows 7 key steps:

1. Removing any respondents with ineligible responses, such as the combination of age and level of education, or have a large amount of missing data. Automated rules are used to flag and reject any records that do not meet minimum standards. The number of rejected records are monitored on a monthly basis.
2. Removing any respondents who give ineligible visit information, such as saying they have undertaken more than 5 day visits at least once a week (this tells us that the visits are in fact, part of their normal routine and so are not tourism).
3. Recoding ‘don’t know’ responses to missing for certain questions (mainly associated with spend). These missing values are then dealt with through the imputation process detailed in 4.5.
4. Applying a ‘Trip Correction Factor’ to account for any visits that were taken within the reference period, but were not reported on in detail. To reduce the survey length, and therefore the burden on the respondent, and the quality of the data collected, a limit is set on the number of visits that each individual respondent is asked to provide detailed information about. This limit is 3 visits. It is possible that an individual respondent could have taken more than 3 visits in the period asked about, although this is rare. The Trip Correction Factor accounts for this. It is calculated by dividing the number of eligible visits by the number of reported visits and is applied to each respondent record. It is a factor of the final volume and value calculations.
5. Converting data from the spend questions to a ‘per adult equivalent’ spend so that data validation rules and caps can be applied on a like-for-like basis. For the purpose of these calculations, we count child spend as half an adult, so we divide the reported spend by an ‘adult equivalent’ by the total of those reported on [number of adults + $\frac{1}{2}$ * number of children reported on]. More information on how spend data is treated can be found in section 4.5.3.
6. Caps and recoding are then applied to the ‘per adult equivalent’ spend data:
 - a. Caps on certain variables to reduce the impact of outliers when users are drilling down to smaller subsets of the data
 - b. Recoding zero spend values to missing where there is sufficient reason to believe spend would have occurred

- c. Imputing any missing values with median per adult equivalent spend for that month
7. Caps and recoding on party size and number of places visited to limit the impact of outliers when users are drilling down to smaller subsets of the data. Set rules are used for when data is capped and the level it is capped at (described in 4.5.1).

It is important to note that where an amount is entered by a respondent, that amount is only ever capped, it is never recoded to missing or imputed. The purpose of the caps is to reduce the impact of outliers when data is analysed, particularly at a sub group level.

The number of records that are capped or removed for being ineligible are monitored on a monthly basis and are reported in this document under 4.5.

4.5. Data compilation

4.5.1. Caps and imputations

As described in 4.4, imputation occurs in 3 instances;

1. When 'caps' are implemented on data (to minimise the impact of outliers)
2. When missing data is replaced (to ensure robust data and therefore data quality)
3. When zero spend data is replaced (when there is sufficient reason to believe spend should have occurred)

Where missing spend data are replaced a two-step process is used:

- A proportion are assigned a zero value. This proportion is determined by the proportion of valid visits that have a zero value, i.e., if 10% of valid visits have a zero response, 10% of missing visits are assigned a zero response
- The remaining missing visits are assigned the non-zero median value of the other visits within that month

The caps and imputations that are applied are as follows:

- DV06 – the number of other places visited within the day visit (aside from the main place). This value is capped at 6 to limit the impact of any outliers. The decision to cap at 6 (i.e., 7 places in total) is based on the understanding that a respondent visiting more than 7 places would only be spending small amounts of time at each place due to the fact that day visits do not include overnight stays of any kind.
- DV15 – the composition of the day visit party. If a respondent enters that they were accompanied by more than 2 husband/wife/partners the value is capped at 2. This is because it can reasonably be assumed that any value greater than 2 is due to an error at data input stage.
- DV15 – the composition of the day visit party. If a respondent indicates at the preceding question (DV14) that they were accompanied by a child, but does not enter any children at DV15, the dummy party size child variable is set to missing and is imputed with the non-zero median of children for that type of visit (defined by DVU2 and DV02).
- DV15 – the composition of the day visit party. If a respondent indicates at the preceding question (DV14) that they were accompanied by another adult, but does not enter any adults at DV15, the dummy party size adult variable is set to missing and is imputed with the non-zero median of adults for that type of visit (defined by DVU2 and DV02).

- DV20_1 – visit spend on road transport (bus fares, taxi fares, car parking). If the ‘per adult equivalent’ spend is greater than £500, the value is set to missing and the two-step process described above is used.
- DV20_2 – visit spend on road transport (all fuel bought during the visit). If the ‘per adult equivalent’ spend is greater than £500, the value is set to missing and the two-step process described above is used.
- DV20_3 – visit spend on rail, tube or tram transport. If the ‘per adult equivalent’ spend is greater than £500 the value is set to missing and the two-step process described above is used. If the main form of transport indicated at DV11/DV12 is rail, tube or tram and the respondent did not state at DV21 that they used a travel card/season ticket any zero values for this spend category are replaced with the non-zero median spend for this category.
- DV20_4 – visit spend on eating and drinking out. If the ‘per adult equivalent’ spend is greater than £500, the value is set to missing and the two-step process described above is used.
- DV20_5 – visit spend on food/drink bought in a shop, market stall or takeaway and consumed during the visit. If the ‘per adult equivalent’ spend is greater than £500, the value is set to missing and the two-step process described above is used.
- DV20_6 – visit spend on ‘speciality’ shopping. If the ‘per adult equivalent’ spend is greater than £2,500, the value is set to missing and the two-step process described above is used. This cap is deliberately set higher than other categories as it could be a high spend category for some respondents.
- DV20_7 – visit spend on entrance to visitor attractions. If the ‘per adult equivalent’ spend is greater than £500, the value is set to missing and the two-step process described above is used.
- DV20_8 – visit spend on tickets/entrance to events, shows, clubs etc. If the ‘per adult equivalent’ spend is greater than £500, the value is set to missing and the two-step process described above is used.
- DV20_9 – visit spend on water transport. If the ‘per adult equivalent’ spend is greater than £500, the value is set to missing and the two-step process described above is used.
- DV20_10 – visit spend on air transport. If the ‘per adult equivalent’ spend is greater than £500, the value is set to missing and the two-step process described above is used. If the main form of transport indicated at DV11/DV12 is ‘plane’ any zero values for this spend category are replaced with the non-zero median spend for this category.
- DV20_11 – visit spend on hiring a car or other vehicle. If the ‘per adult equivalent’ spend is greater than £500, the value is set to missing and the two-step process described above is used. If it is indicated at DV11 that a hire car was used any zero values for this spend category are replaced with the non-zero median spend for this category.
- DV20_12 – visit spend on tickets to watch sporting events. If the ‘per adult equivalent’ spend is greater than £500, the value is set to missing and the two-step process described above is used.
- DV20_13 – visit spend on entrance to sport/leisure centres. If the ‘per adult equivalent’ spend is greater than £500, the value is set to missing and the two-step process described above is used.

- DV20_14 – visit spend on package travel or package tours. If the ‘per adult equivalent’ spend is greater than £2,500, the value is set to missing and the two-step process described above is used. This cap is deliberately set higher than other categories as a ‘package’ includes multiple elements and so it is feasible that spend could be higher.
- DV20_15 – visit spend on other travel services. If the ‘per adult equivalent’ spend is greater than £500, the value is set to missing and the two-step process described above is used.
- DV20_16 – visit spend on other items. If the ‘per adult equivalent’ spend is greater than £500, the value is set to missing and the two-step process described above is used.
- DV22 – spend per place visited. If any spend amounts have been capped or imputed at DV20 the amounts at DV22 are edited to match the new revised total spend, with spend split by place by the same proportions as the respondent split the original spend by place.
- Distance travelled during visit – as respondents select each place they have visited, and their start place, from a pre-defined list of places (gazetteer), it is possible to use the longitude and latitude co-ordinates associated with these places to calculate the likely distance travelled during the visit. This data, combined with the length of time that the respondent said they spent travelling during their visit, and the main method of transport they used, is used to flag any implausibly long distances. These visits are then capped so that only the main place visited is taken in to account (as it was implausible that all places stated were visited on the visit). If the number of children in the party or the per adult equivalent spend are greater than the median for the month these values are also capped at the median amount. This cap was added to the process for 2021 and beyond due to a small number of visits where respondents had entered multiple places very far apart that were having a disproportionate impact on resulting estimates of volume and value. Due to the implausibility of their stated visit, but it not being possible to work out which element of their stated visit was incorrect, it was agreed that their impact would be limited. The process for calculating the distance travelled is as follows:
 - The distance between the start place and each of the places visited is calculated in turn using longitude and latitude co-ordinates. This is the distance ‘as the crow flies’.
 - The maximum distance is determined by whichever of these is the largest
 - The maximum distance is multiplied by 2, to represent the journey to the place, and then the journey back from the place to start place
 - The distance per hour is worked out using this maximum distance and the length of time the respondent said they spent travelling at DV13.
 - If the main form of transport used on the visit was road transport (cars, buses/coaches, trams, motor homes/campervans, lorries/trucks/vans or motorbikes) or tube/underground trains, and the maximum return distance is greater than 100km, and the distance per hour is greater than 200km/h, the visit is flagged for capping, as described above.
- Number of nations visited – if a respondent says that they visited places in all 3 nations (England, Scotland and Wales) within the same visit the visit is capped so that only the main place visited is taken into account. If the number of children in

the party or the per adult equivalent spend are greater than the median for the month these values are also capped at the median amount. This cap was added to the process for 2021 and beyond as it is not plausible for a day visit to travel long enough distances to be able to visit all 3 nations in one visit.

Non-zero medians are calculated each month and take into account all valid visit takers. During the design phase the use of imputation classes, using homogenous groups, such as all takers of a certain type of visits, were explored but were discounted for a number of reasons:

- The resulting bases sizes, particularly for 2020, 2021 and early 2022 when visit taking behaviour was constrained by COVID-19 restrictions, do not support breaking the responses into meaningful groups. There are too many different types of visits to give reliable base sizes to calculate non-zero medians for homogenous groups:
 - For example, in October, the month with the highest number of qualifying visits in 2020, 836 visits qualified as 3hr+ visits. 214 of these visits were zero spend, so the remaining 622 are used to calculate the non-zero median.
 - However, if this 622 is broken down by the main activity undertaken on the visit (the variable that is likely to have the biggest impact on per adult equivalent spend) there are some activity categories with disproportionately small numbers:
 - Visited friends or relatives – 201
 - Went to a visitor attraction – 37
 - Took part in sports or outdoor activities – 43
 - Went sightseeing and exploring areas – 74
 - Took part in hobbies and interests – 75
 - Took part in a health or wellbeing experience - 17
 - Attended a special event or celebration of a personal nature – 26
 - Attended an organised public event - 4
 - Went to an arts, cultural or entertainment experience – 4
 - Food and drink, a night out or speciality shopping – 115
 - Took part in leisure activities not mentioned above – 26
- Demographic or location-based groups were also considered, but similarly, the resulting base sizes did not permit this within each month
- It was considered whether a period of longer than a month could be used to determine the non-zero medians. However, due to seasonal variation in spend, in particular linked to school summer holidays this was discounted
- If imputation classes were used it would result in greater variability in non-zero medians and they would be more susceptible to outliers, meaning a greater risk of imputation skewing results

The vast majority of the imputation that takes place is for spend data and is done so because respondents have stated that they do not know how much was spent on their visit. If values were not imputed for these visits the resulting spend calculations would incorrectly assume that all of the visits where 'don't know' has been selected in fact had zero spend. This would be incorrect, as we know from other visits that spend does indeed occur, and would result in much lower estimations of total spend overall. Therefore, imputation is used to minimise the impact of these 'don't know' responses.

Volume and spend caps were applied to the 2021 and 2022 data as the last step after weighting to manage the impact of unusually large trips or spend. Analysis was conducted on 2021 data to assess the impact of these outliers, some of which accounted for up to 36% of monthly spend or volume for a nation in a particular month. Following this analysis the below caps were agreed and applied, thus reducing the impact of any outlier trips. Each month there are a handful of outliers, meaning that a very small percentage of overall trips are impacted (between 0.05% for England and 0.43% for Scotland). See caps and imputations table on pages 20-22 for details.

Caps are applied to monthly data for each nation. England has a lower percentage cap due to the larger sample size.

- England – cap any trip that is greater than 5% of capped and weighted spend value filtered to England at 5%. Cap any trip that is greater than 2.5% capped and weighted volume filtered to England at 2.5%.
- Scotland – cap any trip that is greater than 10% of capped and weighted spend value filtered to Scotland at 10%. Cap any trip that is greater than 5% capped and weighted volume filtered to Scotland at 5%.
- Wales – cap any trip that is greater than 10% of capped and weighted spend value filtered to Wales at 10%. Cap any trip that is greater than 5% capped and weighted volume filtered to Wales at 5%.

Imputation has its limitations. It assumes that all visit takers who did not give spend information had similar per adult equivalent spends, when we know that spend differs considerably for each visit taken. It also assumes that a similar proportion of visit takers who did not give spend information actually had zero spend as those who did provide spend information. However, the imputation approach aims to balance these limitations against the impact of no imputation.

The impact of the caps and imputations is expected to be very low. They are applied only in extreme cases, where it can be reasonably assumed that an error has been made at the data imputation stage by the respondent or where no data has been given by the respondents. As such the caps levels for spend are set considerably above the average total spend for a day visit (typically between £30 and £40).

In 2022 the following number of caps and imputations were performed:

		January	February	March	April	May	June	July	August	September	October	November	December	Total
Edits to correct for:	Inconsistencies in party size*	7	14	13	6	15	18	17	5	18	9	13	16	151
	'don't know' for party size*	35	19	26	15	28	44	46	12	49	26	34	29	363

*This figure represents the number of edits, rather than the number of visits that were edited. This is because there are separate edits for adults and children in the visit party. The actual number of visits edited will be lower than the number given.

4.5.2. Weighting

Weighting involves re-balancing survey data to more accurately reflect the population, in this instance the population of residents living in Great Britain.

Post-stratification weighting is used for GBDVS to adjust the achieved sample to the known GB population. It is also used to correct for the oversampling of respondents living in Scotland and Wales. Weighting adjusts the results so that weighted totals on a number of key variables agree with known proportions in the GB population of non-overlapping, mutually exclusive cells.

For GBDVS grossed up weights are used. A multiplier is applied to responses so that an indication of what the results would show if the quota sample was representative of the whole GB population can be calculated.

Grossed-up weights are determined by the sample cells and the GB population figures, and are applied to all qualifying respondents, including zero-visit respondents. The weighting scheme applies rim weights as follows:

- Gender (male/female) and age (16-24, 25-44, 45-64, 65-74, 75+) interlocked – resulting in 14 cells
- Region (standard 11 GOR; East Midlands, East of England, London, North East, North West, South East, South West, West Midlands, Yorkshire & the Humber, Scotland, Wales) – 11 cells
- Social grade (AB/C1/C2/DE) – 4 cells

This results in a weighting matrix incorporating 616 cells.

This weighting scheme differs from that used for previous versions of GBDVS. In 2019 and earlier, the weighting scheme (devised by the incumbent fieldwork agency) also incorporated age terminated education, and so resulted in 1,408 weighting cells. The decision to reduce the weighting criteria, and therefore the number of cells was taken to improve the weighting efficiency. Simplified weighting schemes tend to have less impact on the data than more complex ones, so the effect of weighting is 'lighter' and weighting efficiency is higher, thus leading to greater accuracy through lower standard deviation and standard error. Given that analysing small subsets of the data is an important element of GBDVS it was agreed that the weighting efficiency should be improved in this way.

Analysis was conducted on previously collected data (from the 2018 survey) to determine the likely impact of this change in weighting criteria. This analysis used 65+ as the upper age group and interlocked region with gender and age, and so resulted in 352 weighting cells. This analysis, although constrained by the data available, estimated that the change impacted the volume of day visits by -0.4% and the value of day visits by +4.9%. As only one change was made to the GBDVS weighting (the removal of age terminated education), the total impact is also the impact of that specific change.

As mentioned in section 4.1.2 **Error! Reference source not found.**, for the purposes of weighting, the population statistics for NS-SEC from the Annual Population Survey are mapped to approximated social grade. It is not possible to calculate the level of accuracy of this mapping as the question used to derive approximated social grade and the set of questions used to derive NS-SEC are not asked in any one survey together. However, the fact that the population statistics are mapped to approximated social grade before they are used introduces some statistical error. The magnitude of this statistical error is not known, but it is possible that it may disproportionately impact individual social grades.

4.5.3. Derived variables and correction factors

Once the weighting has been applied there are two respondent-level corrections that are applied:

- Trip correction factor
- Partial reporting factor

The trip correction factor accounts for the fact that a respondent is asked detailed questions about a maximum of 3 visits within the reference period, but they can indicate in the universe section of the questionnaire that they took more than 3 qualifying visits within this period. The trip correction factor is calculated by dividing the number of qualifying visits by the number of visits more detailed information was collected about. This correction factor assumes that visits where detailed information was not collected were similar in nature to those where detailed information was collected for the respondent.

The partial reporting factor accounts for the fact that results are reported on a calendar monthly basis, but that each respondent is only asked about the day visits that they undertook within a period of a week. As each calendar month consists of either 4 or 5 whole weeks, the partial reporting factor is always 4 or 5 (depending on the number of weeks in the calendar month in question). It is based on the assumption (in absence of other information) that each respondent, or at least another respondent with similar characteristics, would have had a similar pattern of day visits on the other weeks within the

reporting period. This assumption does not account for irregular visit volumes within a monthly reporting period and so could inflate or deflate visit volumes where individual weeks within a reporting period are atypical, such as during school half-term holidays. However, in absence of other information about the respondent's visit taking behaviour for the remainder of the period it was agreed this partial reporting factor would be applied. The partial reporting factor has been applied in this way in previous years of GBDVS.

Once the respondent-level correction factors have been applied the respondent level file is converted into a visit level file. In this file each reported visit is given its own record, with the respondent specific information (such as demographics, weight and the trip correction factor and partial reporting factor) duplicated.

Three visit-level correction factors are then applied:

- Child trip correction factor
- Child spend correction factor
- Seasonal smoothing factor

The child trip correction factor accounts for children, as they are excluded from the sample (data is only collected from adults aged 16+). Each child is 'shared' across the number of adults in the visit party. The child trip correction factor is calculated by dividing the number of children in the visit party by the number of adults in the visit party.

The child spend correction factor accounts for the fact that a respondent can include spend on behalf of a child in the spend data that they provide. Each child is allocated half of the spend of an adult (as the price of a child is often half of that of an adult on aspects such as transport and entrance fees) and each child is 'shared' across the number of adults in the visit party. The child spend correction factor is calculated by $\frac{1}{2} * [\text{amount of children/number of adults}]$.

In 2021 additional work was undertaken to consider whether the assumption that spend on a child is half that of an adult is robust. This analysis used 2020 survey data. The analysis showed that in 2020 spend on each additional child was 40.8% of spend on each additional adult.

The seasonal smoothing factor (SSF) allows for the comparison of results for the same month across different years. It smooths the effect of reporting months consisting of 4 or 5 whole weeks, and means the resulting estimations give an approximation of the what the estimations would be for a calendar month. The SSF is applied to each visit within a month equally. The SSF is calculated by dividing the number of days in the calendar month in question by the number of days in the equivalent reporting month. Depending on the month in question, the SSF varies between 0.857 and 1.107.

4.6. Adjustment

This section is not applicable as there are no seasonal adjustments or other macro-level adjustments to the data.

5. Quality Management

5.1. Quality assurance

In terms of the supplier for the research, the BMG Quality Management System (QMS) is integral to the BMG business and forms the cornerstone of all aspects of BMG service delivery. The QMS has been created from a number of industry recognised standards. All employees working on a project adhere to the MRS code of Conduct at all times. BMG adopts the tightest quality control processes and the standards under which these have been developed and to which BMG are recognised are listed below:

- ISO 9001:2015; The International Standard for Organisational Quality;
- ISO 20252: 2019; The International Standard for Market Research;
- ISO 27001: 2013; The International Standard for Information Security Management;
- Cyber Essentials Plus certification;
- A Fair Data organisation;
- IQCS; The Interviewer Quality Control Scheme;
- The Data Protection Act;
- The Market Research Society Code of Conduct

A number of quality measures are implemented specifically for this survey. These include:

- Data validation elements built into the survey script
- At the end of each fieldwork period, data is cleaned within the survey system. This cleaning process removes respondents in a number of situations where they are deemed to be 'bad quality':
 - Respondents who display straight lining behaviour, such as selecting the same response at questions where the same scale is used
 - Respondents displaying click through behaviour, such as selecting the first or last option at all or nearly all questions
 - Respondents displaying flatliner behaviour on open questions, such as only entering one character in open ended boxes, or selecting 'don't know' at all open-ended questions
 - Respondents who have JavaScript disabled as this stops some elements of survey displaying correctly
 - Respondents who enter gibberish at open ended questions
 - Respondents who give contradictory age vs. education
- A series of quality checks on data exported from the survey system before data processing begins to ensure the data is as expected and for the correct period
- The use of data caps and imputations at data processing stage
- Quality checks on reports produced from the processed data, including any investigation of outliers

5.2. Quality assessment

Quality assessments are performed on most elements of the survey specific quality assurance process:

- It is not possible to quantitatively assess how well the data validation elements built into the survey script have performed. This is because they do not allow data that doesn't meet the validation points to be entered. As such, no data that does not meet the validation elements in the script was received.

- Survey cleaning took place for each reporting month. The proportion of respondents removed during the cleaning process varies by month, ranging from 5.2% to 13.5%. It was expected that the proportion of removals at this stage would be around 10%. The average proportion of removals over the year was 8.4%, and therefore within the expected range.
- It is not possible to give a quantitative assessment of the quality checks on exported data from the survey system as if any errors were found, the data was re-exported.
- A small number of caps and imputations were performed each month. More detail on these caps and imputations, including the number performed across the year can be found in 4.5. The overall assessment of these caps and imputations are that they are within acceptable levels and only impact a small proportion of visits.
- The number of cases in each monitoring category are monitored each month to ensure that no weighting cells are empty. In 2022, no weighting cells were empty for any of the reporting months.
- It is not possible to give a quantitative assessment of quality checks on the reports produced as if an error was identified it was rectified. No consistent errors were found.

The statistical process was not subject to an internal peer review during the reporting period.

In 2021, the [Methodology Advisory Service \(MAS\)](#) of the Office for National Statistics were asked to provide methodological assurance of changes to methods introduced in 2020 for GBDVS (and for GBTS). There was particular interest in reviewing the survey representativeness and the use of correction factors and imputation. The review was not a formal assessment against the Code of Practice for Statistics.

The report made a number of recommendations and suggestions. A number of these recommendations and suggestions related to the reporting of information in this Background Quality Report. These have been actioned in this version of the report. The recommendations and suggestions also led to a number of specific analyses of data and the survey processes to be carried out. The results of these analyses are referred to in this document where appropriate and where the analysis has shown that improvements have been needed to the methods these have been implemented.

6. Relevance

6.1. User needs

In early 2020 a user needs session was convened with representatives from each of the National Tourism Organisations to better understand the users of the research, and how best to meet their needs regarding the research. The session focussed on the previous iteration of the survey (i.e., in 2019 and earlier), but it is not expected that users or their needs will differ considerably going forward.

13 user groups were identified in this session. These groups, and their identified needs are described in the table below:

User group relative importance	User group	Description	Needs
Primary	National Tourism Organisations	The research and insight teams and other employees within the NTOs that have commissioned GBDVS	To officially produce and publish official statistics. Use data for forecasting, strategic analysis, business planning and evaluation. The data from this survey is used alongside other survey and non-survey information to monitor performance of the visitor economy and to uncover insights into market trends over time.
Primary	National Tourism Organisations' Internal stakeholders	Marketing, Business Development, and PR/Press teams within the National Tourism Organisations	Regular statistics to inform marketing and product development activities. Regular statistics and insights for publicity purposes and to respond to stakeholder requests for information.
Primary	Sponsoring Government departments	The government departments that sponsor the survey	Robust and reliable regular domestic visit statistics to inform economic impact, national and local accountancy and taxation and performance of the visitor economy
Primary	Tourism/ industry trade bodies	Trade organisations that represent different elements of the tourism industry	General and sector specific statistics to support insight generation, strategic planning and monitoring industry performance and impacts.
Secondary (previously primary)	Eurostat	The EU statistical office, responsible for European tourism statistics	Annual tourism statistics in a pre-defined format to feed into database of European tourism statistics
Secondary	Local Authorities	Local government departments responsible for the visitor economy	Tourism statistics at a local level to understand volume and value of local tourism
Secondary	Individual ministers and elected representatives	Elected ministers and their research teams	Reliable information to feed into policy discussion, political briefings and government business
Secondary	Enterprise agencies	Such as Historic England, Historic	Statistics at a local or sector specific level to support

User group relative importance	User group	Description	Needs
		Scotland etc. Includes other non-departmental public bodies	marketing and development activity and understand their user base
Secondary	Tourism businesses	Businesses operating in the tourism sector, and their management organisations	Statistics to use for strategic business planning and to understand investment potential and market opportunities and needs.
Secondary	Press and media	National and local media organisations	To report tourism performance and evidence stories being investigated
Tertiary	Consultants	Consultants operating in the tourism industry, or those in other industries that are consulting on tourism related matters	Information to support what they are consulting on
Tertiary	General public	Individual members of the public with an interest in tourism statistics	Easy to understand tourism statistics in a publicly accessible format
Tertiary	Data aggregators	Companies that take existing secondary data and package it into reports, such as Mintel	Reliable and robust data, published on a regular basis

6.2. User satisfaction

New questions added in 2021 in GBTS and GBDVS capture information on trips taken outside of the UK, more detailed information on activities undertaken, more detailed information on booking methods and timescales and enhanced information on respondent profiles, including protected characteristics. It is envisaged that this additional information will be of value for the various users of the surveys.

The National Tourism Organisations have already informed stakeholders, and users of the statistics, of plans for publishing 2022 data. The NTOs plan to continue with engagement of primary users when 2022 data is published to advise of changes to the survey, and to check

if it meets their needs. Any further survey enhancements required to meet user needs will also be considered.

6.3. Completeness

There are currently no specific relevant legislation, regulation or guidelines that are applicable to the survey.

However, in the past it was a requirement of European Commission regulation 692/2011 that specific tourism aggregated data was transmitted to Eurostat on an annual basis. The survey was designed to meet these requirements. Even though the data no longer needs to be submitted, the survey continues to use Eurostat definitions for what constitutes a day visit and follow Eurostat guidance on classifications such as type of place visited.

7. Accuracy and reliability

7.1. Overall accuracy

As the data is derived from a non-probability sample survey a quantitative assessment of accuracy is not possible. However, a qualitative assessment is provided below.

The main sources of potential accuracy error are predicted to be:

- Coverage error due to the use of an online panel methodology, meaning that the survey does not reach the part of the population that does not have online access
- Measurement error due to respondents entering incorrect values
- Non-response error due to the availability of 'don't know' and 'prefer not to say' options

7.2. Sampling error

GBDVS is a quota sample and so sampling error cannot be calculated. The results are projected from the sample to the population of interest (GB adults aged 16+) with assumed levels of precision, meaning that an approximation of estimated confidence intervals for survey estimates can be constructed. This calculation is not the same as it would be for a probability sample.

The GBDVS data are weighted to correct for any imperfections in the achieved sample that might lead to bias and also to rectify any differences between the sample and the target population. More information on the weighting scheme is given in 4.5.

The main risk of sampling bias lies in the possibility of differences in attitudes or behaviours of the online panel population, compared to the target population. This bias has three components:

- Differences between those who have online access compared to those who do not have online access
- Differences between those who join an online panel and those who do not join an online panel
- Differences between those who choose to complete the survey and those who do not

This bias is difficult to measure, and therefore, difficult to correct for. However, the first component of this bias is predicted to be very small, as 96% of all GB households had access to the internet in 2020².

7.3. Non-sampling error

7.3.1. Coverage error

As a quota sample is used, in this case coverage error and sampling error are considered to be the same. Efforts to reduce this error include utilising a mix of panel partners to mitigate for possible panel specific biases, and keeping this panel mix consistent over time. Quotas are also derived from total population statistics, rather than based on panel population statistics to ensure no demographic groups are under-represented.

7.3.2. Measurement error

It is inevitable in any survey that there is a risk of measurement error due to incorrect values being entered. This error is predicted to be small in the case of GBDVS, due to the steps taken to minimise this risk:

- The use of a self-completion survey, removing the risk of measurement error caused by interviewers mishearing or misunderstanding responses
- Detailed survey instructions that clearly tell each respondent what is needed from them at each question, with extra attention to more complicated questions, such as those which ask about spend
- Data validation built into the survey script, which automatically checks responses against those previously given where relevant
- A number of 'soft checks' that ask respondents to check unusual responses and amend them if necessary
- The provision of 'don't know' and 'prefer not to say options' so that a respondent can answer truthfully
- A carefully designed and tested survey and script, that automatically renders to different devices, optimising how each respondent views each question
- A dynamic survey set up that asks respondents about their day visit taking behaviour in the full week prior to the date of survey completion. This reduces the risk of recall being affected by the survey taking place considerably after the behaviour occurred

7.3.3. Non-response error

Non-response error due to the availability of 'don't know' and 'prefer not to say' options is likely to be the largest potential source of error in the data collection. These options have deliberately been included to reduce measurement error, which typically has a bigger impact than non-response error on the resulting data. Questions which collect details about the amount spent on a visit are identified as having the largest risk of non-response error.

Measures to reduce the risk of non-response error include clear and detailed survey instructions.

2

<https://www.ons.gov.uk/peoplepopulationandcommunity/householdcharacteristics/homeinternetandsocialmediausage/bulletins/internetaccesshouseholdsandindividuals/2020>

The imputations that take place at the data processing stage (described in 4.5) help to reduce the impact of this error, but do not mitigate against it completely.

The number of visits that have required imputations due to non-response will be carefully monitored on a monthly basis and stated in the annual reports. They are also stated in this document in 4.5.

7.3.4. Processing error

It is not expected that processing error will occur due to errors in the transformation of data into computer readable formats. This is because specially designed software is used to collect the data, which automatically stores the data in the necessary formats.

However, there is a risk of processing error in the form of the regular and ad-hoc reports produced from the survey data.

7.4. Data revision

7.4.1. Data revision – policy

Any possible data revisions would be unplanned.

In the event of a data revision being identified, that impacts data in the public domain, the following procedure will be followed:

- Need for the data revision is flagged to the National Tourism Organisations and or/ the data supplier as soon as possible
- A clear description of the data error is explained, including an assessment of the impact that this has had on the results
- The reports that are affected by the error are amended and re-released, including an explanation of the error and the impact that it has had

Each National Tourism Organisation also has their own procedure for handling data revisions. These can be found here:

- VisitEngland - [https://assets.publishing.service.gov.uk/government/uploads/system/uploads/attachment_data/file/865444/Compliance Statement - February 2020.pdf](https://assets.publishing.service.gov.uk/government/uploads/system/uploads/attachment_data/file/865444/Compliance_Statement_-_February_2020.pdf)
- VisitScotland - <https://www.gov.scot/publications/producing-official-statistics/pages/revisions-and-corrections/>
- Visit Wales - <https://gov.wales/statistics-and-research-statement-revisions-errors-and-postponements>

7.4.2. Data revision – practice

There have been no data revisions of the 2022 GBDVS data.

7.5. Seasonal adjustment

This section is not applicable as estimates are provided without seasonal adjustment. Visit behaviour has seasonal patterns and it is important for this to be evident in the estimations.

8. Timeliness and punctuality

8.1. Timeliness

Headline data for all months of 2022 is planned to be published in June 2023. The time lag between the reference period and the publication of the first results (i.e., the first month, January 2022) is 18 months. The time lag between the reference period and the publication of the last results (i.e., the last month, December 2022) is 6 months.

These are extraordinary time lags and do not represent the originally planned publication timings for the 2022 data. The delay to the 2022 data was a result of the 2021 data having to be re-processed. The 2021 data was delayed for the following reasons:

- The ongoing COVID-19 pandemic in 2021 that caused a pause in data collection for the first 3 months of the year
- Uncertainty of the impact of the COVID-19 pandemic on data, and therefore the ability to make comparisons to previous years – this resulted in additional analysis taking place and a consideration of whether adjustments needed to be made to the survey and the way in which the data is processed
- An error was identified that stemmed from a change in the definition of an eligible visit not being fully implemented in the processed data. Although data had been shared internally with the survey sponsors at this point, no data had been shared in the public domain. All data was subsequently re-run with the error fixed (and several other adjustments made)
- A decision to revise key elements of the data process, including the definition of what qualifies as an eligible visit. This resulted in a need to re-process the data for 2021
- A decision to introduce the seasonal smoothing factor (explained in 4.5.3). This resulted in a need to re-process the data for 2021
- A decision to introduce caps to volume and spend requiring a rerun of all 2021 data. This is the reason for the June 2023 re – release of the 2021 GBDVS statistics

All of these factors are extraordinary and are not expected to occur in the future. Typically, under normal reporting timings, we would expect a time lag of up to 8 weeks from the end of each monthly reference period to the publication date. This expected time lag is made up of:

- 1 week to complete data collection
- 1-2 weeks for data processing and reporting
- Up to 4-5 weeks for quality assurance and official publishing processes for the National Tourism Organisations

Each National Tourism Organisation will have their own publication schedule, which will be displayed on their website, and will detail what types of data are expected to be released and at what point. It is likely that VisitScotland and Visit Wales will only publish statistics quarterly, whereas VisitEngland are likely to publish statistics monthly.

8.2. Punctuality

No publication schedule was made available to users for 2022 due to the ongoing COVID-19 pandemic and the changes anticipated to the data over the period. Therefore, punctuality cannot be measured. However, the extraordinary time lag described above is not within expectations and it is not expected to be repeated. It is expected that a release schedule will be published of future results.

9. Coherence and comparability

9.1. Geographical comparability

Geography in terms of the place of residence, place of visit origin and place of visit destination are all derived from respondent defined fields within the survey. For all of these measures the respondent is asked to select a place from a gazetteer of villages, towns and cities in the UK. Subsequent classifications for local authority, region and country are all derived from this selection.

As these measures are selected by each respondent there is a small risk that an incorrect place could be selected. However, all appropriate steps possible are taken to reduce this risk.

The gazetteer was built specifically for the GBDVS and GBTS. Its starting point was an annually updated gazetteer produced by the Office of National Statistics³. Several changes were made to this list to ensure that the coverage was as complete as possible and as simple as possible for respondents to use:

- Places in Northern Ireland were added using a combination of a gazetteer produced by OSNI⁴ and a list built by comprehensive internet searches
- Duplicate places were removed to avoid respondent confusion. Where places have more than one commonly used spelling or name each commonly used instance was left in the list to allow respondents to select the name that they are most familiar with
- Local authority name was appended to each place name in parenthesis, e.g., Edgbaston (Birmingham) to reduce the risk of respondents selecting incorrect places, particularly where multiple places with the same name exist
- National parks were added into the list as places in their own right. This allows respondents to indicate that they visited a national park, even if they do not know the name of the nearest city, town or village to where they visited
- Additional classification information was appended to the gazetteer to allow all of the necessary analysis and reporting breakdowns, e.g., NUTS classification, urban/rural classification

The main limitation on comparing results across different regions or other geographical entities is the number of responses collected for that area in any given month. Where the number is very small the level of accuracy of results is greatly reduced and subject to

³ <http://geoportal1-ons.opendata.arcgis.com/datasets/e8e725daf8944af6a336a9d183114697> An ArcGIS login is needed to access the data

⁴ http://osni-spatial-ni.opendata.arcgis.com/datasets?q=Gazetteer&sort_by=relevance

greater variability. This is particularly pertinent when looking at results for Scotland or Wales, or smaller regions, such as local authorities, or national parks. As such, it is recommended that where results are needed for smaller geographies, such as regions, sub-regions within nations or local authorities, results are analysed at either a quarterly, 12 month or year to date level. In some cases (most notably local authority level), results can be analysed across a number of years.

In terms of comparison of the UK with other European countries, the survey is deliberately designed so that results are comparable with other countries' data collected through Eurostat. The latest Eurostat guidelines⁵ have been followed in terms of how a visit is defined and how the data is structured.

9.2. Comparability over time

GBDVS has been running on a regular basis, in some form, since 2011. However, for the 2021 survey onwards it was agreed that a number of changes would be made. These changes include:

1. A change in the online panels being used to collect the data
2. A change in the definition of a 3hr+ visit
3. Excluding visits that started from holiday accommodation
4. Excluding visits that were part of an overnight trip
5. Amends to the list of activities undertaken
6. Change in how regularity of the visit is measured
7. Change in the wording of the question about visit duration
8. Change in how 'outside of usual environment' is defined
9. A simplification to the weighting criteria
10. A move from manual imputations to an automated process based on firm rules

This, together with the interruption in data collection due to COVID-19, meaning data was not collected for the first 3 months of the year, means that results are not directly comparable to published data for 2019 and preceding years. Furthermore, in 2019 and previously, only adult volumes were reported, whereas from 2021 onwards combined adult and child volumes are reported. This means that estimations of visit volume from 2021 onwards should not be compared with 2019 and earlier years.

Due to the COVID-19 pandemic fieldwork for 2021 did not begin until April, meaning that no data was collected covering the period from 1st January to 28th March 2021. Data was collected covering all of April 2021 onwards for England, Wales and Scotland. It should be noted that day tourism was not permitted in Scotland for the first week of April 21 and so estimations reflect that no visits were undertaken during that period. January to March 2022 data cannot be compared to January to March 2021 as fieldwork was paused during that period.

The Covid 19 pandemic in 2021 seriously impacted tourism and the ability and likelihood for the population to undertake tourism day visits, particularly in the earlier months of the year. In some areas of GB, visits for leisure purposes were forbidden or seriously discouraged by

⁵ <https://ec.europa.eu/eurostat/web/products-manuals-and-guidelines/-/KS-GQ-14-013>

the government. These restrictions and guidelines have differed by nation, and sometimes by smaller geographical areas.

9.3. Coherence – cross domain

The only area of possible cross-domain coherence is with the International Passenger Survey (IPS). There is a single question in the GBTS and GBDVS survey that asks about outbound travel (OA1). There are no current plans to publish the data collected at OA1 for 2022, but in theory the results to OA1 could be compared to the estimates of outbound travel derived from the International Passenger Survey (IPS).

The surveys are not directly comparable due to differences in data collection methods; while GBTS and GBDVS uses online data collection and aims to be representative of the GB population, the IPS uses face-to-face data collection at UK major air, sea and tunnel ports and only surveys those travelling through these ports. Furthermore, as only very limited data is collected on outbound travel in GBDVS and GBTS, only rough estimations of the proportion of GB adults that went overseas in a period can be produced, whereas IPS collects much more in-depth data and can produce much more robust estimates on the volume and value of outbound trips.

9.4. Coherence – internal

This section is not applicable

10. Accessibility and clarity

10.1. News release

At the time of writing this report no news releases had been published relating to 2022 data.

10.2. Publication

At the time of writing this report no publications of the statistics had been made in relation to 2022 data. Publication of headline results is expected in June 2023.

10.3. Online databases

At the time of writing this report no online databases were available for the 2022 data. An online database is planned for release in 2023, and it is expected that data for 2021 and 2022 will be included in this database.

10.4. Micro-data access

There are no plans to make 2022 data available in micro-data form.

10.5. Other

No other disseminations of data are planned.

10.6. Documentation on methodology

This report is the main documentation on the methodology for 2022 data.

10.7. Quality documentation

This report contains the main quality documentation for the 2022 data. This information can be found in sections 5.1 and 5.2.

11. Cost and burden

11.1. Cost

The management of the costs is shared amongst VisitEngland, Visit Wales and VisitScotland. Initial cost savings have been recognised by combining parts of the surveys in the online methodology approach – with respondents routed to either GBTS/GBDVS where more detailed data is captured. This approach offers more efficiency and agility, for example questionnaire changes can be implemented quickly and efficiently compared to the face-to-face methodology.

11.2. Burden

The average time taken to complete the survey is 13 minutes and 38 seconds. Over the course of 2022, 34,491 surveys were completed. The total respondent burden in terms of time was 7,692 hours.

It is worth noting that as the survey data is collected via an online survey it is possible for respondents to leave the survey page open for a period of time even though they are not interacting with it. The average time measures the entire time that the survey was open, irrespective of whether respondents were actively engaging with it for all of that time or not. Therefore, the real time burden is likely to be a little lower.

The following measures have been implemented to reduce respondent burden:

- The survey is device agnostic and automatically renders to different devices, so the layout is optimised for screen size
- A comprehensive review of the questionnaire was undertaken when the contract was taken over by the current agency to identify and remove or amend any unnecessary questions
- Automatic routing is built into the survey so that respondents do not see questions that they do not need to answer
- Respondents are only asked to give detailed information about ‘qualifying’ day visits – i.e., those that meet the 3hr+ description
- The number of qualifying day visits that a respondent is asked detailed questions about is capped at 3
- The survey layout is specifically designed to be clear and simple to follow, as is the survey language
- Respondent instructions are clear and kept to a minimum
- The survey is available in Welsh for respondents who speak Welsh as a first language
- The survey software supports the use of screen readers for people with sensory impairments
- Respondents are compensated for their time in the form of panel incentives (this differs by panel, but is typically in the form of points that can be redeemed for cash or vouchers)

Dropout rates were monitored in detail during the pilot and are monitored on a regular basis by Qualtrics. They do not signal that any particular part of the questionnaire is

challenging. The vast majority of drop outs during the pilot stage occurred at the introduction screen, which is a normal occurrence for online panel surveys, and reflects respondents changing their mind about wishing to do the survey.

12. Confidentiality

12.1. Confidentiality – policy

Publication of all data from GBDVS is at an aggregate level. However, there is still national and European legislation that is applicable in terms of data confidentiality. These are:

- Data Protection Act 2021
- UK General Data Protection Regulation
- The Market Research Society Code of Conduct

Respondents are assured that the information that they provide will be treated as confidential and that no individual responses will be publicly disclosed. Due to the online panel methodology of the GBDVS, no personally identifying information is collected as part of the survey (such as respondent names, email addresses or full postal addresses). The survey does, however, collect personal information, some of which is sensitive personal information by asking demographic questions.

For the purposes of GDPR the survey sponsors (VisitEngland, VisitScotland and Visit Wales) are the data controllers. BMG and Qualtrics are data processors.

12.2. Confidentiality – data treatment

All cells where there are fewer than 5 visits will be suppressed in all public reports. This includes monthly and annual reports, as well as the online data viewer.

13. Sample Base Sizes

13.1. Number of visits 2022 estimations are based upon

Although the annual sample target is 35,000 respondents for GBDVS, not all respondents take a visit in the reference period they are asked about. Furthermore, some respondents take more than one visit in the period asked about. The tables below have been provided to help users understand the number of visits that estimations for 2022 are based on. It should be noted that it is possible for a visit to be to more than one nation, so the sum of visits to England, Scotland and Wales is typically higher than the count of visits to GB. It is also possible for a visit to not have a region assigned to main place visited, so the sum of the regions will not always match that for the country.

13.2. Description of appendices

The appendix of this report includes the full questionnaire, which is a combined GBTS and GBDVS survey. Also included in the appendix is the statement of terms of the organisation that administers the survey.

14. Appendix: Questionnaire

Thank you for agreeing to take part in this survey. We hope you will find it interesting.

The survey is about holidays and day trips you've taken recently. It's on behalf of several public bodies and what you tell us will be used to measure UK tourism and shape the industry. The names of the commissioning public bodies are available at the end of the survey.

We understand that the constraints imposed due to the health crisis are challenging and might have prevented you from doing any trips or activities recently, but we'd still love to hear from you.

The survey takes around 15 minutes to complete.

Click the button (→) below to start the survey.

Enjoy the survey!

Data Protection Notices

Your responses will be treated in the strictest confidence. BMG Research abides by the Market Research Society Code of Conduct at all times. We will protect the confidentiality of your information in accordance with our normal data handling procedures and all legal requirements. We will not use it for any purposes other than those which are set out in the survey.

You can find out more information about our surveys and what we do with the information we collect in our Privacy Notice which is here www.bmgresearch.co.uk/privacy

By clicking the (→) button, you agree to participate in the survey and for BMG to process all information collected.

15. Appendix: Statement of Terms

Compliance with International Standards

BMG complies with the International Standard for Quality Management Systems requirements (ISO 9001:2015) and the International Standard for Market, opinion and social research service requirements (ISO 20252:2012) and The International Standard for Information Security Management (ISO 27001:2013).

Interpretation and publication of results

The interpretation of the results as reported in this document pertain to the research problem and are supported by the empirical findings of this research project and, where applicable, by other data. These interpretations and recommendations are based on empirical findings and are distinguishable from personal views and opinions.

BMG will not publish any part of these results without the written and informed consent of the client.

Ethical practice

BMG promotes ethical practice in research: We conduct our work responsibly and in light of the legal and moral codes of society.

We have a responsibility to maintain high scientific standards in the methods employed in the collection and dissemination of data, in the impartial assessment and dissemination of findings and in the maintenance of standards commensurate with professional integrity.

We recognise we have a duty of care to all those undertaking and participating in research and strive to protect subjects from undue harm arising as a consequence of their participation in research. This requires that subjects’ participation should be as fully informed as possible and no group should be disadvantaged by routinely being excluded from consideration. All adequate steps shall be taken by both agency and client to ensure that the identity of each respondent participating in the research is protected.

With more than 25 years' experience, BMG Research has established a strong reputation for delivering high quality research and consultancy.

BMG serves both the public and the private sector, providing market and customer insight which is vital in the development of plans, the support of campaigns and the evaluation of performance.

Innovation and development is very much at the heart of our business, and considerable attention is paid to the utilisation of the most up to date technologies and information systems to ensure that market and customer intelligence is widely shared.
